Conclusion

Heston Model Definition

Assume that the spot asset at time t follows the diffusion

$$dS(t) = \mu S(t)dt + \sqrt{v(t)}S(t)dZ_1(t), \quad (1)$$

$$dv(t) = \left(\delta^2 - 2\beta v(t) \right) dt + 2\delta\sqrt{v(t)}dZ_2(t), \quad (2)$$

where Z_1, Z_2 are the correlated Wiener processes with $dZ_1dZ_2 = \rho dt$

Conclusion

Conclusion

We introduced the three most common simulation methods for dynamics of the Heston stochastic volatility model:

1. Euler scheme
2. Broadie-Kaya scheme
3. Andersen scheme
